MEDICAID TRENDS IN ALABAMA: A RESEARCH ANALYSIS STUDY

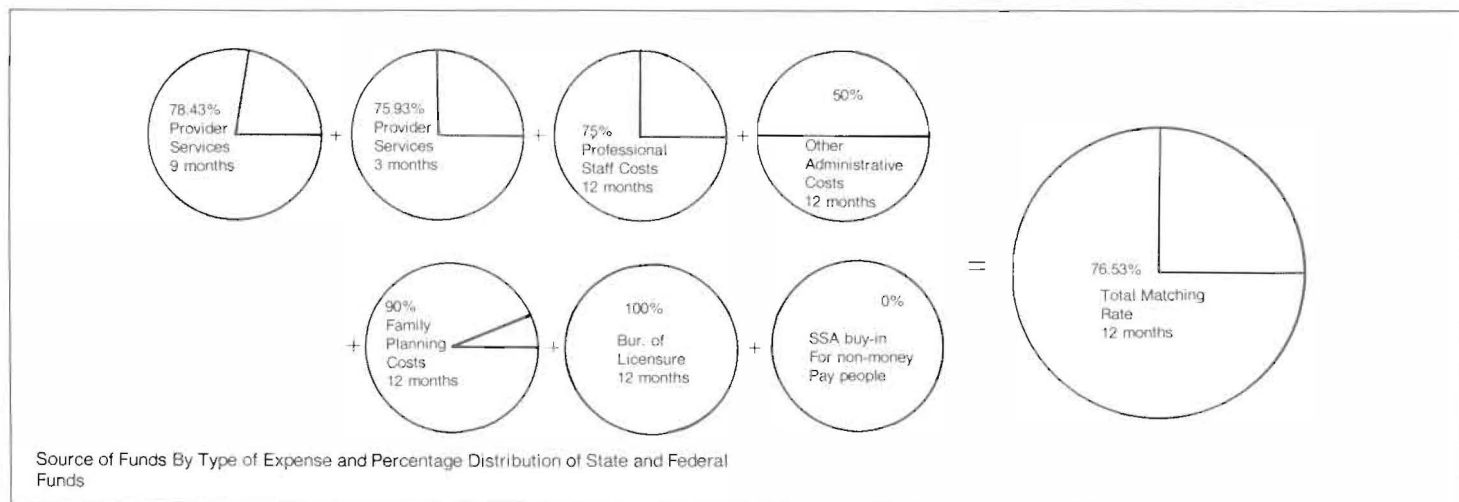

INTRODUCTION

Medical Services Administration (MSA) presents its first management report on total Medicaid activities for Alabama fiscal year 1973 (AFY '73). The fiscal year in Alabama operates from October 1 through September 30. This fact alone has caused many problems in presenting information on a uniform basis, because there are three possible years to report — Alabama fiscal, federal fiscal, or calendar year.

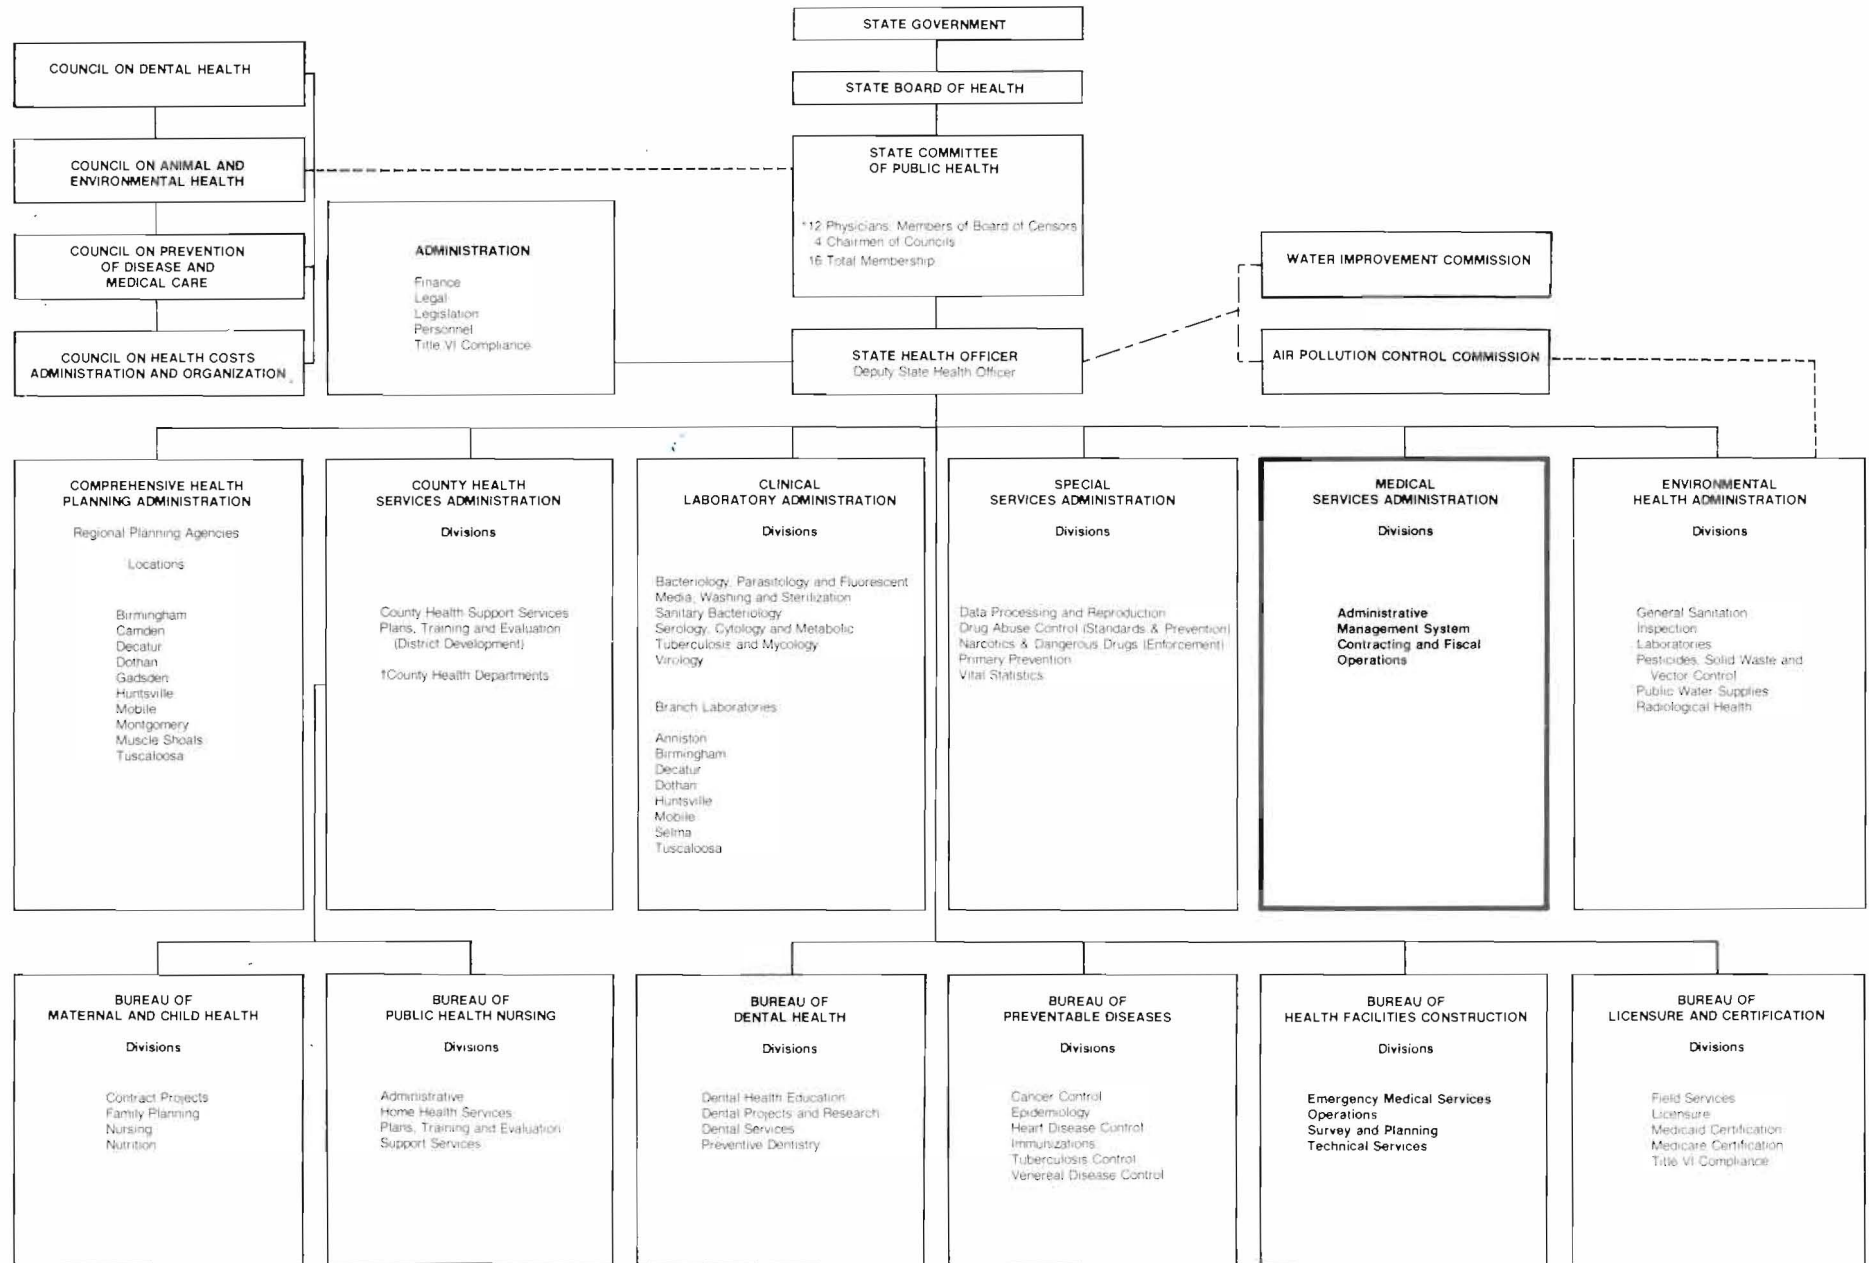

Although this is the first management report, Alabama has participated in Medicaid since January 1, 1970. Medicaid, as a program of medical assistance for the needy administered by the states in accordance with provisions of Title XIX of the Social Security Act, covers 4 groups of beneficiaries under the following titles:

- Title I - Old Age Assistance (OAP)
- Title IV - Aid to Families with Dependent Children (AFDC)
- Title X - Aid to the Blind (AB)
- Title XIV - Aid to the Permanently and Totally Disabled (APTD)

By executive order of the Governor, the Department of Pensions and Security of the State Welfare Department, has been designated to determine who is eligible or qualified for public assistance grants. Likewise, by executive order of the Governor, Medical Services Administration of the Department of Public Health, under the authority of the State Board of Health, provides medical assistance to those determined eligible. During AFY '73 payment for medical services was financed until July, 1973 by 78.43% Federal funds and 21.57% State funds. However, in July, 1973 the matching rate changed to 75.93% Federal and 24.07% State. The ceiling on Federal participation is 83%. After considering professional staff salaries matched at 75%, and other salaries and administrative costs matched at 50%, in addition to the 90% matching on family-planning benefits and administrative costs, and 100% matching on the contract with the Bureau of Licensure and Certification, the total matching rate for administration and benefits for the fiscal year was 76.53%.

ORGANIZATION OF THE ALABAMA DEPARTMENT OF PUBLIC HEALTH

Administrative Relationship —————

Chairmanship Relationship - - - - -

Advisory Relationship - - - - -

*Change By 1973 Legislative Act to be Activated in 1974.
Effective 1971

†Acts as County Health Officer as required, and as Consultant to others.

ADMINISTRATION

For AFY '73 there was an appropriation of \$22,000,000. Considering \$6.9 million brought forward from the previous year, imprinter rental funds, insurance premium refunds, third party collections, provider overpayment recoveries, and retroactive adjustments, there was a cash balance of \$10,829,930 state money as of September 30, 1973. This cash balance was carried forward for the next year's use. Net expenditures for AFY '73 were reported by the Fiscal Division as \$84,943,766.

In accordance with State and Federal Regulations for Title XIX, payment for services under Medicaid is always secondary to other third party liability. Thus, there must be adequate determination that other available benefits have been exhausted before applying Medicaid benefits. If not, then there must be an attempt to recover due funds. In this respect, Alabama has been very successful in recovering \$536,030 during the year, which was applied to reduce expenditures.

Medical Services Administration presently employs 83 personnel (as of June 30, 1973) including 8 Licensure and Certification persons who spend at least 50% of their

time in behalf of Medicaid. The staff is composed of 41 administrators and specialists (professionals) and 42 clerical personnel. At that time there were 11 vacancies. The organization is divided into 4 main sections: Administrative Division, Operations Division, Contracting and Fiscal Division, and Management Systems Division.

Alabama has chosen to have an outside intermediary process its claims for the past 4 years. In AFY '73 Blue Cross and Blue Shield was awarded the bid contract to process Medicaid claims, part of which was sub-contracted to Central Computer Services of Birmingham. Blue Cross is responsible for claims for physicians, hospitals, complementary A and B, home health care, screening, dental services, hearing aids and services, family-planning, and lab and x-ray services. Central Computer Services handles claims for drugs, both skilled and ICF nursing facilities, and optometrics.

The total administrative cost of MSA was 4.19% of the funds expended for all purposes. The administrative cost of the intermediaries was 56% of the total administrative cost.

SERVICES — DEFINITIONS, DESCRIPTIONS, AND LIMITS

In the text of this report the term "eligible person" is used to refer to one who has been certified to Medical Services Administration by the Pensions and Security Department as being qualified to receive Medicaid benefits — i.e., if the person is qualified to receive welfare assistance, he is qualified to receive all available Medicaid benefits. (The Dental and Hearing Programs are exceptions.) A "recipient" is a person who has actually received a service during the year. Alabama had approximately 368,000 persons eligible for at least one month during AFY '73, while there were 261,000 recipients, or 71% of the eligibles, who used the services.

The services provided are as follows:

- Physicians' services
- Hospital services, in-patient and out-patient
- Lab and X-ray
- Drug
- Eyeglasses and eye care

- Family-Planning
- Home health care
- Skilled and Intermediate nursing facility care
- Screening, including dental services,
hearing aids and tests (for those under 21)

Although Medicaid has accepted approximately 1,000 mental health transfer patients in the nursing homes, it does not cover ICF mental facilities, nor mental hospitals, as such. Neither does it cover TB hospitals, per se. During AFY '73 the policy was not to provide skilled nursing care to persons under 21 unless they were in the category of blind or disabled. Dental services and hearing services were limited to those persons under 21 in conjunction with the screening program.

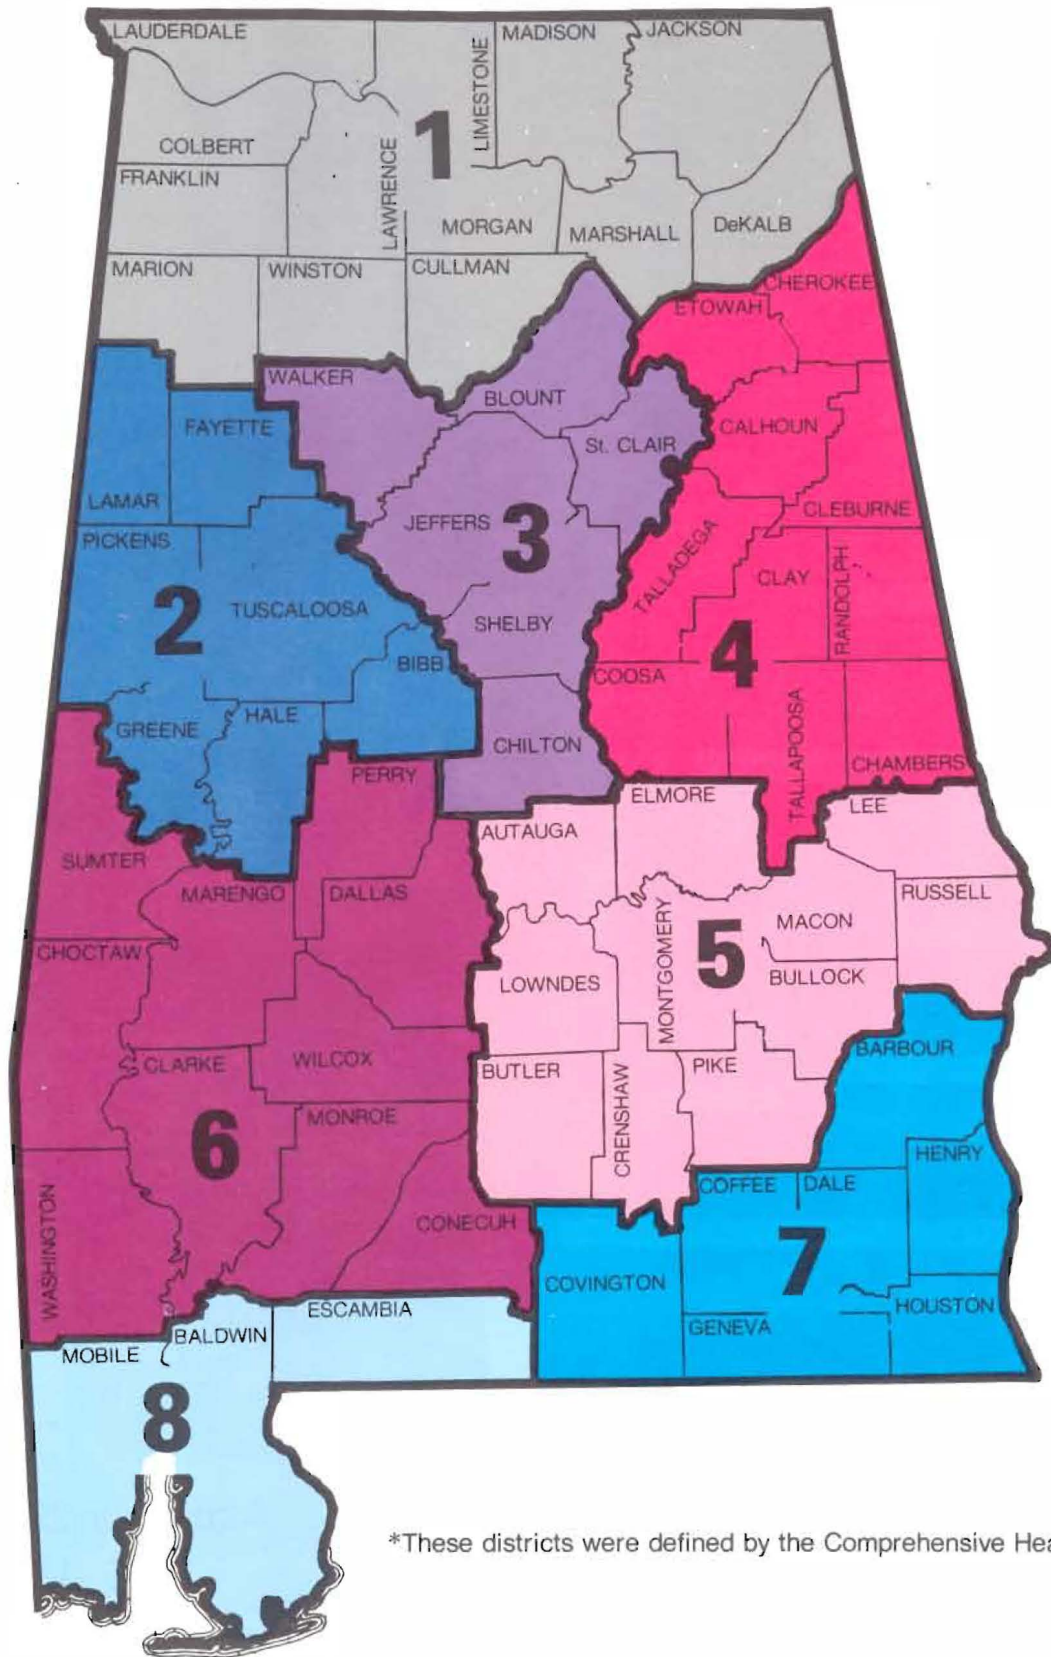

The following report gives further details regarding the program. It is hoped that this will be helpful and informative to all those concerned in Medicaid and other health care programs.

DEMOGRAPHICS

The population of Alabama in 1973 was approximately 3,485,000 persons within an area of 50,856 square miles. Alabama is divided into 67 counties which have been grouped by the Comprehensive Health Planning Agency into 8 districts as shown in Plate 1. Based on 1970 figures the population densities of the districts varied from 23 persons per square mile in the Selma District to 174 persons per square mile in the Birmingham District. (Plate 2) In 1970 51.8% of the population was female; 73.6% of the population was white; and 9.5% of the population was age 65 or over. In the aged population the

females account for 58.4% of those over 65. The Selma District has the lowest percent of urban population, while the Birmingham District has the highest urban population percentage (Plate 4). The poor in 1970 accounted for 25% of the Alabama population compared to 13% for the nation. (Plate 5) In Alabama 15% of the whites are designated as poor, while 52% of the non-whites are poor. (Plates 6 and 7) The Selma District has the highest population percentage of non-whites in the state, while the Tennessee Valley District has the highest percentage of whites in the population. ALABAMA HEALTH RESOURCES

Based on a survey of the Comprehensive Health Planning Administration, the various manpower availabilities for health services are shown in Plate 9. In all instances Alabama is below the national averages in providers of health services per 100,000 population. The Selma District is lowest in physicians, registered nurses, and pharmacists. The Montgomery and Gadsden Districts are lowest in dentists, and the Tuscaloosa District is lowest in optometrists. The highest ratios of physicians, dentists, and pharmacists occur in the Birmingham District, with the highest ratio of nurses in the Mobile District, and the highest ratio of optometrists in the Dothan District.

RACE, POVERTY, AND ELIGIBILITY

Though approximately 25% of Alabama's residents are poor, only 11% are eligible for Medicaid. See appendix B for definitions of the poverty level. A close inspection

of Plate 11 reveals that only 11% of the whites are not eligible, whereas almost 27% of the non-whites are not eligible.

SEX, AGE, AND ELIGIBILITY

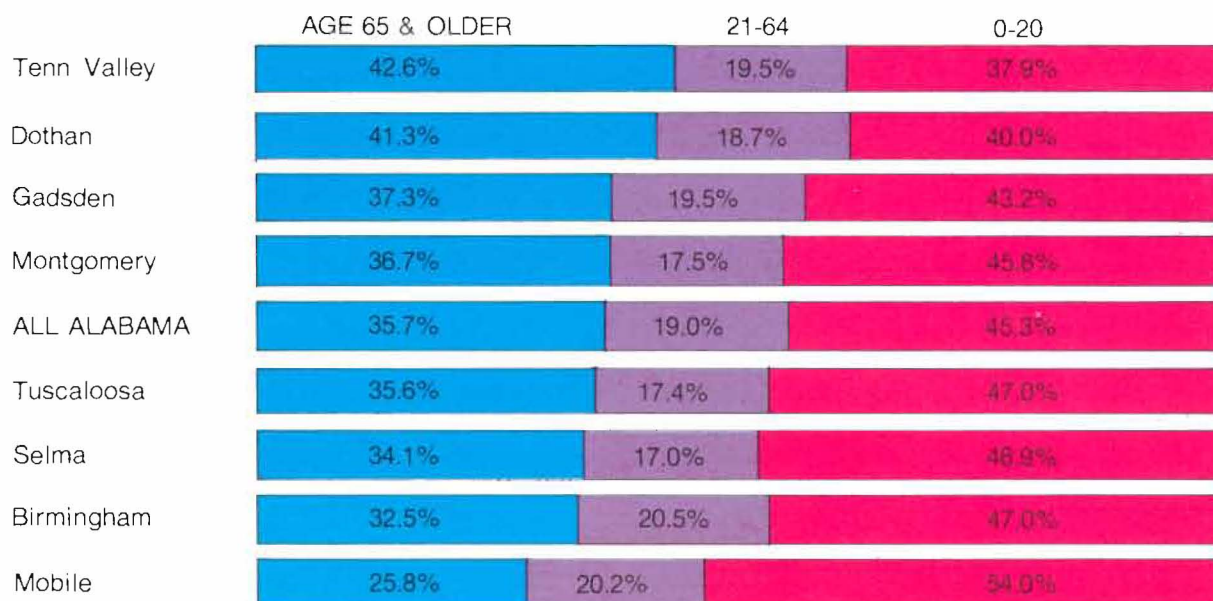

From Plate 14, it is apparent that the ratio of eligibles by sex is fairly constant throughout the districts, about 63% female to 37% male for the state. However, Plate 14

lower shows that the Mobile and Selma Districts have the highest percent of young eligibles, while the Tennessee Valley District has the highest percent of aged eligibles.

MEDICAID PAYMENTS

There was \$90,500,918 paid to vendors for Medicaid services in Alabama Fiscal Year 1973 (AFY '73). This figure includes the co-insurance and SSA payments, but does not account for refunds or third party recovered funds. An average monthly payment was \$7,541,743. Plate 15 shows that nursing facility payments, both skilled and ICF, consumed 38.0% of the AFY '73 budget, while in AFY '72 the percentage was 29.8% , producing an increase of 8.2% in nursing facility expenditures. Some of this increase was attributed to the transfer of former mental health patients to nursing facilities under the Medicaid program. As is evident, there was a relative decrease in the percent of expenditures for skilled nursing care. Alabama did not have any intermediate care mental health facilities during AFY '73.

Hospital services ranked second in percentage of budget expenditures at 24.4% for both in-patient and out patient benefits. This was also an increase from the 23.0% for AFY '72. Physicians payments, including SSA payments, ranked third in budget expenditure with 21.8% , but this was a decrease from the 25.4% spent the previous year. Drugs ranked fourth at 12.0% which was a slight decrease over last year. This decrease can be attributed to allocating the contraceptives to the Family Planning Program, rather than to the drug program.

In AFY '73 there was significant expansion of the Screening Program which extended coverage to the 12-20 age-group of children as of April 1, 1973. The Dental Program also got its start in October, 1972, and Family Planning Services were implemented as of March 1, 1973. All of these factors will account for the increase of "Other Services" from 1.4% in AFY '72 to 2.1% in AFY '73.

Plate 16 shows relative distributions of expenditures by category, age, race, and sex. In AFY '73 over 61% of the payments were for benefits to Category 1 (Aged) recipients. The AFDC Adults and the disabled persons accounted for almost equal percentages of expenditures at 13.5% and 14.5% respectively, while the children accounted for 10% and the blind less than 1% .

By age group it is not surprising that those age 65 and over consumed 63% of the expenditures followed in declining age sequence by the middle adults at 25% , the school-age children at 7.9% , and the pre-school-age children at 3.6% . As the number of older persons who are eligible for Medicaid increases, the benefit payments will increase disproportionately for the over-65 group.

The whites consumed 54.5% of the expenditures and non-whites 45.5% , while females received 76% of the benefit dollar and the males received the remaining 24% of that dollar.

MEDICAID ELIGIBLES

During AFY '73 there were 368,706 unduplicated persons eligible for at least one month. The average number of eligible persons per month was 303,344. Plate 17 shows that the dependent children in Category 3 constitute the highest percentage of eligible persons followed by the aged in Category 1, then the AFDC adults in Category 3, the disabled in Category 4 and the blind in Category 2. The last three groups are much smaller than the first two.

Eligibles by category, race, and sex are described in Plate 18 with the factor of age replacing race and sex, in Plate 19. Referring to Plate 20, 63% of the eligibles were female; 61% of eligibles were non-white, and 45% of the eligibles were young (under 21). It could be further stated that 27% of the eligibles were females under age 21 but that 25% were aged females. Also, 34% of the eligibles were young non-whites, and 21% aged whites.

MEDICAID RECIPIENTS

For AFY '73 there were 260,583 unduplicated recipients out of the 368,706 eligibles showing a utilization rate of 71%. Some of these recipients had more than one type of service during the year, but each did receive one Medicaid benefit. The average number of recipients per month was 115,003 out of 303,344 eligibles per month, which shows that approximately 38% of the monthly eligibles enter the treatment cycle each month (Plate 22).

Characteristics of the recipients given in Plate 22 show that 69% are female, 63% are non-white, and 44% are aged (35% are young). "Young" here means under 21. "Aged" means age 65 or over.

By referring to the previous section on Medicaid Eligibles one can see that females utilize the available services somewhat more than males and the aged utilize the services much more than those under 65.

MAN-MONTHS

Man-months are a unit of measurement. By using them one can count the months of eligibility used by a group (a category, a sex, a race, or an age group). With two counts one can compare two groups (Plate 25), or trace the change between two time periods for a single group.

In addition to counting man-months of eligibility (MME), it is also necessary to count the number of months in which eligibles use their eligibility. These units (Plate 26) are called "man-months of medical service." (MMS)

To find the number of MME used in a month, count the number of people who were eligible that month, and likewise, for a year add the numbers used in all 12 months of that year. (An alternate way to calculate the MME for a year is by multiplying the monthly average by 12.)

In AFY '73 Medicaid paid for, 3,640,128 MME (Plate 25). Since these MME were used by 368,706 eligibles dur-

ing the year, the average eligible held his eligibility card for 9.87 months during the year.

Using 9.87 months as the norm, it is seen that the aged, blind, and disabled held their cards for longer than this average time, while AFDC eligibles (particularly the children) held their cards for less than the average time. Plate 25 gives the average MME for each category.

Plate 26 shows the number of MMS that Medicaid paid for during the year. This total (1,380,036 MMS) is approximately 1/3 the total for MME (3,640,128 MME). This ratio of 1 to 3 indicates that the average eligible card holder used his card about every third month (He may have used it more than once a month.) In fact one would expect each average eligible to use his eligibility card for 3.74 man-months, while the average recipient would receive medical benefits during 5.30 months.

TURNOVER RATES

Turnover rates are also a unit of measurement, to determine the rate at which old eligibles are replaced by new eligibles.

Among all eligibles in AFY '73, approximately 1/5 of the people who were eligible at the start of the year lost their eligibility during the year, and were replaced by new names on the eligibility list. More precisely, the percent was 19.3% (Plate 27), slightly less than 1 in 5. If this rate

continues, it would take 5 years and 2 months for a complete turnover (Plate 27).

For aged and blind eligibles the turnover rate in AFY '73 was only about half as rapid. At last year's turnover rates these two groups would hold their cards approximately twice as long as the average of all eligibles. Dependent children turnover faster than average. The other two groups had turnover rates very close to the average rate.

AFY '73

TURNOVER RATES

Expected Period of Eligibility	9 years	10 years 6 months	3 years 10 months	4 years 9 months	5 years 9 months	5 years 2 months

Source: Plate 17 of this publication

UTILIZATION RATES

Utilization rates measure the percent of eligibles who become recipients — that is, the percent of eligible persons who use their cards during the year. As Plate 28

shows, this percent last year, for all eligibles, was 70.7% . Among the aged the rate was much higher (85.8%) and among dependent children much lower (53%).

COST PER ELIGIBLE AND PER RECIPIENT

The measurements provided by man-months, turn-over rates, and utilization rates, show that some groups (the aged, the blind, and the disabled) make more use of Medicaid than other groups. Plate 29 compares the cost per individual rather than comparing the cost per group. In Plate 29 the AFY '73 annual cost per person was not equal to 12 times his monthly cost. This is because the average person was not eligible for 12 months of the year.

On a monthly basis in AFY '73 the most expensive eligible was the disabled person, who cost \$53.90 a month (35% more than a person age 65 or older). On an annual basis the disabled person remained the most expensive, costing \$543 a year; but he had become only 25% more expensive than the person age 65 or older.

Plate 29 shows 2 cost comparisons for eligibles and recipients: cost per month and cost per year.

COST AND USE PER SERVICE

Plate 30 takes 2 basic figures that have been used repeatedly in this report, and relates them to each other in a variety of ways.

The basic figures are:

1. Total cost for the year was \$90,500,918
2. Total number of recipients for the year was 260,583

Section I is a refinement of Plate 15 which shows how much of total payments was spent for each service: \$10,894,298 for drugs, \$12,095,099 for physicians, etc. Plate 30 further divides these totals per service, to show how much of each total was used by each category. In an analogous way, Section II is a refinement of Plate 22. It shows how

many of each category received each service. Section III is related to (but is not a refinement of) Plate 29, on annual costs per recipient. Section IV is a refinement of Plate 28, on utilization rates.

Plate 31 is a graphic presentation of Sections I and II of Plate 30. It demonstrates which services benefit the most people and which are the most expensive. The apparent inverse relationship between cost and number of persons benefitted is particularly evident here — nursing facility benefits cost the most but benefit very few people; drugs are provided to more people than any other service and yet the cost for this service is relatively small.

IV. Long-Term-Care Program

PHYSICIANS' PROGRAM

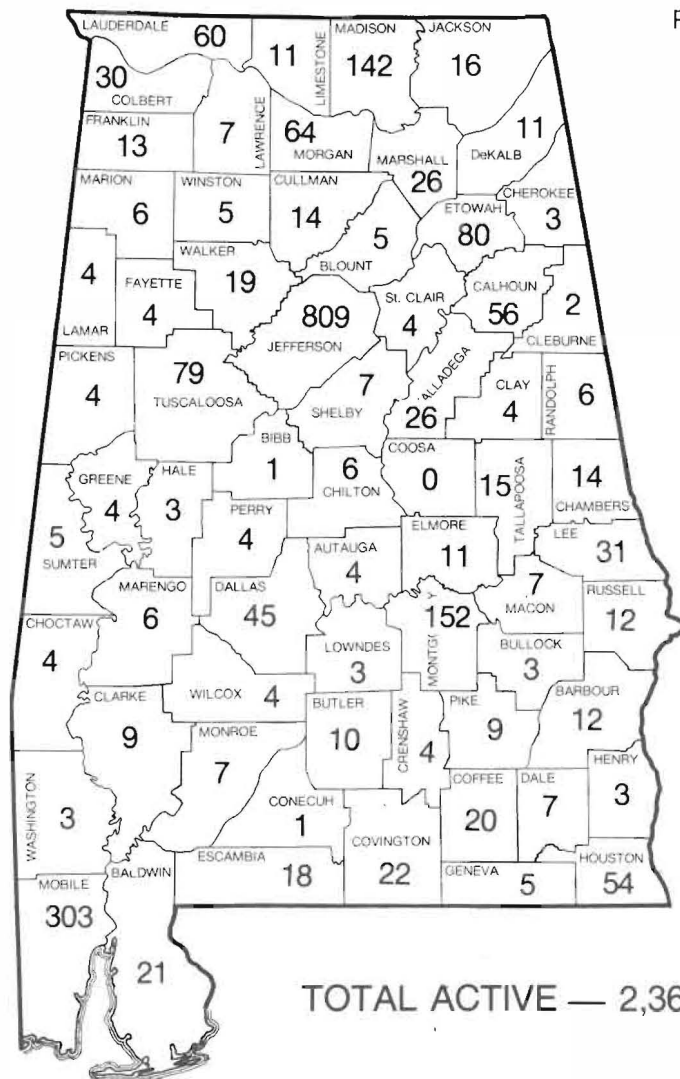

Doctors of Medicine or Osteopathy, in Alabama, initiate most medical care — they either provide it directly or by prescribing or arranging for additional health benefits, such as drugs, nursing care, laboratory tests, or devices, or by admitting patients to medical institutions and directing the medical care therein. According to the

state Medical Association there were 2,362 active Doctors of Medicine in Alabama as of July, 1973. (See Plate 32) There were additional physicians who were designated as retired, semi-retired, public health, military, etc., but only the active physicians were serving in full capacity to the community.

PLATE 32

1973
PHYSICIANS' PROGRAM

Number of active physicians, by county

Source: MASA survey (#9)

Physicians in Alabama may participate in the Medicaid Program as general medical practitioners or specialists. Doctors of Dentistry and Optometry also participate. In the Screening Program physicians must sign agreements with the Medical Services Administration to provide child screening services because of cost limitation; however, in the other programs physicians are not required to sign agreements. They may provide medically necessary care to any eligible person who requires such care. According to the IRS 1099-Report during 1973, there were 1,879 physicians who were reimbursed by Medicaid

funds for care provided to Medicaid recipients, excluding deductible and co-insurance payments for Medicare patients. This does not include the dentists, who will be discussed in the next section.

Plate 33 lists the thirty most common procedures billed by the physicians for Medicaid patients during AFY '73. Plate 34 lists the "Top Ten Types of Procedures" by expenditure. Perhaps, it is somewhat surprising that the third highest expenditure is for obstetrical service. Both of these plates refer only to payments made to physicians and dentists. They do not include hospital payments.

Psychiatric or psychological evaluation or testing are covered services, if these services are rendered by a physician in person and are medically necessary. During AFY '73 Medicaid paid \$88,550 for psychiatric services, including \$7,736 for electroshock treatments. One physician has also been authorized to use methadone therapy.

The use of Physicians' Assistants is recognized by Medicaid. In accordance with the rules and regulations under Act 1948, Regular Session of the Alabama Legislature, 1971, Physicians' Assistants can be utilized as quoted: "The physician's assistant is only to work when

the physician is present or on duty." The physician's assistant may not make physician required visits to medical facilities to qualify for payment to the physician or to satisfy current regulations as to physician visits.

Physicians submitted claims for services to 189,624 persons during AFY '73. Of these recipients, 12% were under six years old, 44% were over age 65 and the remainder were divided equally between ages 6-20 and ages 21-64.

Plate 35 also shows that 31% of these recipients were male, and 35% were white.

Dentists

The Dental Program was initiated in October, 1972, for all eligible persons under twenty-one years of age. A provider for the Dental Program must be a Doctor of Dentistry, licensed in the state in which the service is provided, and in the private practice of dentistry or in a dental clinic approved to render care for Medicaid patients. Under Medicaid, dental health care is provided as part of the Early and Periodic Screening, Diagnosis and Treatment Program. Eligible persons in the over 21 age group are limited to dental procedures which are considered as (a) surgery related to the jaw, (b) the reduction of any fracture related to the jaw or facial bones, or (c) surgery within the oral cavity for removal of lesions or the correction of congenital defects.

Effective in August, 1973, every person who received the health screening examination was to be referred to a dentist if he had not had a check-up within the calendar year.

Plate 37 shows the number of available dentists by area, as defined by Blue Cross, and the number of Medicaid participating dentists. These are dentists who have billed the intermediary for dental services rendered to eligible persons. The participation rate for Alabama dentists, as of September, 1973, was 24% — out of 1,178 dentists, 288 had provided care. This care was provided to 8,107 out-patient and 21 in-patient recipients. During the year, the county health department dental clinics treated 445 recipients and were reimbursed almost \$7,000.

SCREENING PROGRAM

The County Health Departments have played an important part in the success of the Medicaid program. They have helped particularly in providing services for child screening and also in Home Health, Laboratory, Family-Planning, and Dental Programs. In AFY '73 the health departments were paid \$521,316.

Alabama has 725,000 residents under age 12, and 775,000 more from 12 through 20 — totaling 1-1/2 million under 21. When last year began 78,000 were eligible for screening, all of them under age 12. In April the age limit was raised to include all under 21, and for the rest of the year eligibles averaged 129,000 per month. Throughout the

year a total of 165,000 had been eligible at one time or another — over 1/10 of the 1-1/2 million Alabamians now under age 21.

Of this number a total of 26,995 (Plate 39) were screened in '72-'73 — an average of 2,250 a month. To put this average in perspective, however, it is important to add that the number screened per month was rising rapidly at the end of the year. The average for the last half of the year was up to 2,761 per month. The total children screened since October, 1971 was over 50,000 by the end of AFY '73, approximately 34% of the children who were eligible during that time. (Plate 38)

Plate 42 shows how many referrals, of each kind, came from each health district. Plate 43 shows the percent of the districts' referrals which were for six specified conditions.

The purpose of this graph is to stress areas where specific problems appear. For example, the Mobile Area reports a high amount of eye condition referrals;

Montgomery reports significant anemia conditions; Selma has a very high level of reports on intestinal parasites.

Although immunizations are not required to be reported by the health agency, many of the counties are doing so. Medical Services Administration has been very pleased with this attempt to protect the children from unnecessary health problems.

SCREENING PROGRAM

Percent of selected conditions referred by district

PHARMACEUTICAL PROGRAM

The Alabama Medicaid Pharmaceutical Program has been operative since January, 1970. Providing drugs to Medicaid recipients is a state option under Title XIX. In other words, the Pharmaceutical Program is not a mandatory one by law. However, the benefits of this program far outweigh the appropriations required for it to function. Many patients who receive care from other state agencies, are able to receive drugs from the Medicaid Program with no cost to those state agencies.

Throughout Medicaid's history, the Pharmaceutical Program has operated to assure physicians a reasonable choice of drug therapy — a broad enough choice to support the normal practice of medicine. There always has been a strong desire to prevent any discrimination in medical treatment of Medicaid recipients. Therefore, the Alabama Drug Code Index (ADCI) has offered a selection of more than 3,000 drugs covering over fifty therapeutic categories. Additions are made to the ADCI periodically with special attention given to keeping the drug list current, and effective. The physicians, as well as the pharmacists, are notified of these revisions, and also of revised policies and procedures.

The continuous cooperation of the intermediary who has handled the Pharmaceutical Program since its inception has contributed significantly to the overall success of this program. Current and adequate information has been provided to Medical Services Administration on a regular basis for the past four years. To a great extent, this reliability has enabled Medicaid payments to be made on

a timely basis and patient needs to be served at the same time.

As of September, 1973, there were 984 providers who had signed contracts to dispense medication under the rules and regulations proposed by Medicaid. These providers are reimbursed by means of a bank draft which is imprinted with certain pertinent information and then deposited in a bank, just like a check. After traveling through the Federal Reserve System, the draft is processed for payment (pre-audited and either paid or rejected) at the Central Bank of Alabama, N. A. in Decatur. The draft must be paid or returned within 48 hours of receipt.

During AFY '73 the intermediary paid 3,033,764 drafts for \$10,934,925.57 (this includes family-planning drugs). The reject rate for AFY '73 was 1.85% — that is, of all the claims processed, only 1.85% were returned to the pharmacists. A claim may be rejected for incorrect data regarding recipient number, drug code, or pharmacy number, or combinations thereof. Any suspected price overages are billed to the provider at the end of the month, and then incoming checks reduce the standing accounts receivable. There is an imprinter rental charge of \$4.00 per month, which is also billed to the provider monthly.

The average cost per eligible person for drugs in AFY '73 was \$29.66 per year, as shown in Plate 44. The average number of prescriptions per eligible person varies from 2.5 prescriptions for the AFDC Category up to 17 prescriptions for the disabled eligibles, to give an average of 8 claims per eligible per year.

Nursing Facility Drug Recipients

The Alabama Medicaid Pharmaceutical Program provides drugs to nursing facility patients, as well as to outpatients. Of the total expenditures for drugs, 13% was for drugs provided to nursing facility patients, an amount of \$1,526,349. There were 13,745 unduplicated nursing facility patients who received 450,171 prescriptions during calendar year 1973. The average cost for a nursing facility prescription was \$3.39 (including the dispensing fee), which is below the overall average of \$3.66 per prescription. The average number of prescriptions per nursing facility recipient was almost 33 per year compared to around 15 per year (3,033,764 prescriptions for 208,043 recipients) for the total drug recipient population. Likewise, while the average cost per drug recipient was \$52.56 (\$10,934,925 per 208,043 recipients), the cost per nursing facility drug recipient was more than double at \$111.04 per year.

The top 25 drugs dispensed to Alabama nursing facility patients under Medicaid are shown in Table 46. Almost 25% of all nursing facility prescriptions were for 13 drugs, while almost 35% of the prescriptions were for 25 drugs.

Mental Health Transfer Patients

According to claims payment data, Medicaid paid drug charges for 844 mental health transfer recipients during calendar year 1973. These patients were identified by a nursing facility survey performed by Medicaid in which the nursing facilities were asked to identify any recipient specifically who had previously been in a mental institution. These 844 patients had 22,041 prescriptions filled at a cost of \$83,421. This represents a drug cost of \$98.84 per person per year. This is well above the AFY '73 average cost per recipient of \$52.56 (\$10,934,925 per 208,043 recipients) and is also above the average cost per old age and

disabled recipient, at \$78.47 and \$85.67, respectively. Considering that these patients receive the more expensive drugs, tranquilizers and antiparkinsonism agents, it is not unexpected that their average cost per recipient would be higher.

The Medicaid Drug Program also pays for several drugs used by many mental clinic out-patients who qualify for Medicaid. It has not been possible, so far, to identify exactly what amount of funds have been spent on these patients, which would otherwise have been charged to the Mental Health Program.

Analysis of Drug Expenditures

Since Alabama's Pharmaceutical Program is handled through banking channels, the reports supplied are based on a calendar year. The following discussion and charts will be in calendar year time periods.

Plate 47 is a recap of pharmacy provider payments during calendar year 1973. The average number of recipients per month was 85,024 with an average prescription cost of \$3.66.

The top 200 drugs ranked by number of charges account for 1,948,020 perscriptions or 62.4% of the total perscription count. The top 25 drugs represented 781,799 charges (25.1%) while the top 50 drugs added up to 1,091,086 (35.0%). The top 10 over-the-counter (OTC) preparations by expenditure were:

- | | |
|----------------------|-----------------------|
| 1. Tylenol tablets | 6. Mylanta suspension |
| 2. NPH Insulin U-80 | 7. Percogesic tablets |
| 3. Dramamine tablets | 8. NPH Insulin U-40 |
| 4. Maalox suspension | 9. Feosol Spansule |
| 5. Ascriptin tablets | 10. Persisten tablets |

OTC prescriptions constituted 16.5% of the total number of charges and 10.5% of the total amount of charges.

The "controlled drugs" (previously called "narcotics" and "drug abuse" items) in the top 200 list represented \$657,715 or 5.8% of total drug expenditure. The top ten controlled drugs by expenditure were:

- | | |
|-------------------------------------|---|
| 1. Butisol tablets 30 mg. | 6. Noctec capsules |
| 2. Empirin Compound #3 tablets | 7. Phenaphen #3 capsules |
| 3. Meprobamate 400 mg. tablets (P) | 8. Phenergan/cod. Expectorant |
| 4. Phenobarbital 30 mg. tablets (L) | 9. Meprobamate 400 mg. tablets (Alliance) |
| 5. Percodan tablets | 10. Butisol 15 mg. tablets |

There were 2,573,676 legend prescriptions for \$10,-135,891 dispensed and 507,508 OTC prescriptions for \$1,-185,037 during calendar year 1973 (these do not add to the totals of 3,121,019 prescriptions and \$11,424,850 because of excluding charges by dispensing physicians). Medicaid paid \$3,860,514 for legend fees to retail pharmacists and approximately \$391,062 for OTC fees to give \$4,251,576 for fees in the Medicaid Pharmaceutical Program.

PHARMACEUTICAL PROGRAM

Percent of drug expenditures by therapeutic categories

The Therapeutic Drug Category Report was organized based on the American Hospital Formulary Society therapeutic category code numbers; however, this system was liberally applied to meet the requirements of the Alabama program. Plates 49 and 50 show the relative percentages of the drug categories to the total expenditures. Plate 51 shows the drug category activity over a period of four calendar years.

During the first two years of the drug program central nervous system drugs represented a large percentage of expenditures. Although it has since decreased, the latest figures indicate that the category is going back up, no doubt due to recent drug inclusions to handle the mental health transfer patients in nursing facilities. The cardiovascular drugs have increased in usage, as well as the hormones and water balance agents (diuretics). Autonomics have decreased in expense, no doubt due to the exclusion of most peripheral vasodilators.

Review of providers activities is presently performed by three field investigators, assisted by the routine control documents provided by the computer system. On recommendation, many cases are reviewed regarding high usage of drugs. Subsequently, recipients, pharmacists, and physicians are contacted about these situations. Cooperation to date has been most satisfactory. Considering that the drug program provides medical care to more recipients than any other program offered, it is felt that valid utilization review procedures are necessary to maintain a high quality of care to the patients.

LONG-TERM CARE PROGRAM

Long-term care is by far the most expensive item in Medicaid's budget. In Alabama last year it cost over \$34 million — 36.8% of all money spent (Plate 15). The number of patients who receive this care is small — 15,409 last year — but the cost per patient is high, presently about \$2,053 per year (Plates 30 and 52). The average patient who needs this service needs it not for a few weeks, but for about 20 months.

The total cost per patient in AFY '73, was about \$3,500. This high cost coupled with the rapidly rising demand for nursing home care creates questions of priority. If the number of nursing facility patients continues its present growth, the money that Medicaid spends per patient will have to be limited. Even so, it will be difficult — perhaps impossible — to prevent this one service from taking an ever growing portion of Medicaid's annual budget.

Source: Central Computer Services (#7)

Plate 53 shows two more trends that have been increasing Medicaid's outlay for nursing homes. (1) the rates charged by nursing facilities are rising; (2) Medicaid is paying an increasing percentage of the monthly charges.

The high cost of nursing facility care creates a need to give it only to those who need it most. Do some groups or

some areas use this service more than others? Plates 54 and 55 show that 91% of the users are aged. By national standards this is not a high percentage. However, the fact that 85% of the users are female, and 65% white show greater use by these two groups than their proportions in the total population might indicate.

Plate 56 compares use of this service by health district. In three districts (Selma, Dothan, and Montgomery) the number of aged people per bed is above the state average. In other words these districts are short of beds compared

to the 5 other districts, and this shortage could reduce the number of Medicaid nursing facility patients there. In two of them, however (Dothan and Selma) the percent of available beds used by Medicaid is above average.

CONCLUSION

The data assembled here was chosen to answer questions about the costs and benefits of present Medicaid programs. What services were bought? Who received the services? What did each service cost? Such answers have practical value in helping administrators decide what changes, if any, would help Medicaid make the best use of its available resources.

The data also reveals the beginnings of several trends in the costs and uses of services. Do these trends have predictive value? Only to the extent that they show the direction in which costs and uses are now moving. The direction and speed of these movements, however, have largely been shaped by the decisions of legislators and administrators. Whether the trends will continue at their present pace, or change markedly, also depends largely on policies — on human decisions about how Medicaid can best use its resources.

Some trends — such as the growing demand for nursing home care — may seem to reflect uncontrollable social conditions rather than policies. Even here, however, it is difficult to know whether supply or demand is the independent variable. For this reason we have paid minimum attention to trends, preferring to focus on description of present programs and their costs and benefits. With this kind of information, all people involved should make better decisions about how Medicaid, and new companion health-care programs now on the horizon, can best serve the needs of the people.

APPENDIX A

Selected figures from previous years
for comparison with current figures

'72-'73	303,344	115,003	\$7,541,743	\$90,500,918

APPENDIX B

Definition of Poverty

A "poor person" in this report is one who has an income below the poverty level, as that term is defined by the U.S. Bureau of Census and the Social Security Administration.

The line that separates poor from non-poor is not the same for all people, it depends on family size, and other factors, as shown in the table below. Regional differences in cost of living are not taken into account by this table of poverty thresholds. Nor are the effects of rising costs since 1969 reflected in the table. This is the table as it was revised in 1969 for use in conjunction with the decennial census of 1970.

Weighted Average Thresholds at the Poverty Level in 1969, by Size of Family and Sex of Head, by Farm and Nonfarm Residents

Size of Family	Total	Nonfarm			Farm		
		Total	Male Head	Female Head	Total	Male Head	Female Head
All unrelated individuals	\$1,834	\$1,840	\$1,923	\$1,792	\$1,569	\$1,607	\$1,512
Under 65 years	1,888	1,893	1,974	1,825	1,641	1,678	1,552
65 years and over	1,749	1,757	1,773	1,751	1,498	1,508	1,487
All families	3,388	3,410	3,451	3,082	2,954	2,965	2,757
2 persons	2,364	2,383	2,394	2,320	2,012	2,017	1,931
Head under 65 years	2,441	2,458	2,473	2,373	2,093	2,100	1,984
Head 65 and over	2,194	2,215	2,217	2,202	1,882	1,883	1,861
